

# FeOH Hydrous Iron Oxide Traps Oxygen Inside of the Mud Drum, its Corrosiveness will Damage the Boiler at this Point.

LM1 10/11/20

## Watertube High Mass Boilers

Return water laden with FeOH Hydrous Iron Oxide aka “Dirt” enters the high mass boiler, velocity is reduced in the large water storage area and the Dirt drops out into the lower header.

Lower header know as a Mud Drum where “Dirt” precipitates and is known as “Mud”. Tappings permit the Mud to be flushed out.
